

# VeriConnect<sup>CS</sup>

## Central Station Receiver Telephone Line and Line Card Testing Software

*The security industry's first automated software solution for testing central station alarm receiver telephone lines and receiver line cards*

**The VeriConnect<sup>CS</sup>** software from ES Source, loads onto your PC running Windows XP<sup>®</sup> operating system. Simple to set up and completely automated, works with all manufacturers receivers. Gives you the ability to test – verify – log an unlimited number of receiver lines, both locally and even remote sites via Dial-up, Internet or WAN connections.

### **VeriConnect<sup>CS</sup> software overview...**

- You register into the software all of the receiver line card telephone numbers to be tested
- You set the test schedule in the software
- The software generates a Contact ID formatted test signal and calls all of the telephone numbers registered
- Test calls are not logged as successful until received by the automation system and “kissed off” by the receiver, therefore true end-to-end verification is assured
- Unsuccessful attempts are reported to backup up phone numbers and received by the alarm monitoring automation system
- Works with all manufacturers receivers and unlimited number of telephone lines (subject to software license purchased)

**TRY IT FREE IN YOUR CENTRAL STATION FOR 30 DAYS  
NO RISK – NO OBLIGATION**
